

Global Agriculture:

The survival of us all depends on

About one third of the global population works in agriculture, making a living and contributing to food security. The share of the population varies greatly from one country to another.

Overcoming future challenges

The global population is growing, and one of the big questions of our time is how we can produce enough food for everyone. The problem is that land is becoming more and more scarce and thus more valuable, while the impacts of climate change are increasing.

The United Nations have set out 17 Sustainability Goals, to be implemented by 2030. Agriculture plays an important role for many of them.

Goal 2: Zero Hunger

Fighting hunger worldwide is one of the 17 Sustainable Development Goals. Promoting food production in areas with strong population growth will be key.

It seems as though the only way to achieve these goals is by developing new cultivation methods, smart management, foresight and especially responsible behaviour when it comes to buying and enjoying food and reducing waste. It depends on each and every one of us.
